Disposable Orthopedic Foam Boot Liner

“Designed for infection control and patient safety.”

Infection Control

The disposable boot liner is a single use product designed for infection control and patient safety. Even when the foot is covered with a webril or coban wrap, the top portion of every patient's foot is in constant skin contact with any liner that is re-used.

Patient Comfort

The disposable boot liner is composed of non-molded, expandable foam that adjusts to the contours of both the patient's foot and the traction boot. This product is able to be used on most fracture tables currently in hospitals.

Patient Safety

The disposable boot liner expands to occupy the internal space of the traction boot, creating a secure fit and aiding in prevention of the foot slipping when traction is applied. Slipping of the foot inside the traction boot can create direct pressure on the peroneal nerve, possibly causing a foot drop.

Available in 4 Sizes
